Detailed description of the design including the CONTROL treatment and the POLICY treatment. Please particularly outline the intervention in the POLICY treatment in detail.

We will examine the effect of visual salience (low vs. high) of a message communicated by an organization that lobbies for institutionalized carbon pricing. When the visual information in the message is salient (e.g., carbon emissions spread out), we predict individuals will consider donating to the organization's efforts compared to when the same information is presented in a less salient manner (e.g., emissions localized). Participants will see the following information:

Ceres is a nonprofit advocacy organization accelerating a cleaner, just, and sustainable economy through powerful investor and company networks, proving sustainability as the bottom line.

Ceres Lobbies for Carbon Pricing Policies: Key Activities

- Engaging with lawmakers to advocate for carbon pricing policies.
- Partnering with companies to align business strategies with climate science.
- Raising public awareness and support for carbon pricing.
- Publishing evidence-based reports on the benefits of carbon pricing.
- Forming alliances with stakeholders to support carbon pricing.

Ceres is organizing a free webinar titled **"Essential Carbon Pricing: Policies for a Sustainable Future."** This initiative gathers industry leaders, policymakers, and the public to discuss carbon pricing's role in tackling climate change, spurring economic growth, and ensuring sustainability. Participants will learn about the latest research, policy updates, and best practices. **Participants will be automatically enrolled in the petition, "Urge Your Senator to Expedite Carbon Pricing Policy Implementation."**

<Treatment/Intervention>

<Control>

Detailed description of the outcome variable "real-world support for a price of carbon" and especially its real-world impact.

We will measure individuals' willingness to enroll in a petition that pressures their senator to expedite carbon pricing implementation. This will be the primary outcome variable. In addition, we will ask participants to donate to the organization in support of their lobbying for carbon pricing. Participating in the petition and individual donations are both real behavioral measures that can impact the implementation of institutionalized carbon pricing.

1. Would you like to register for Ceres' upcoming webinar, **"Essential Carbon Pricing: Policies for a Sustainable Future"** at a time that is convenient for you?

[Please note that all webinar participants will be automatically enrolled in the petition **"Urge Your Senator to Expedite Carbon Pricing Policy Implementation"** upon completing the registration process.]

- Yes, I would like to register for the webinar now.
- No, I am not interested.

2. Would you be willing to donate a portion of your bonus remuneration to Ceres, if you are selected for the bonus? If yes, please indicate the amount you wish to donate using the sliding scale below (from 0 to 2 USD).

Please indicate in 3-5 sentences whether and why the conditions for the shortcut IRB apply to your experiment.

The proposed research will be reviewed by the project team's university research ethics board.

In addition, the research will comply with the specific design conditions for experiments at the University of Innsbruck.

Please specify your incentive structure.

We will pay participants 3 USD in addition to the flat payment required by Prolific (2 USD)

Is the treatment effect identifiable using OLS, a probit/logit, or an ordered-logit model?

Yes.

What is the estimated length of the experiment? (excl. policy survey)

8.0 minutes.

Is your proposal using incentives?

Yes.

What is the average payment per participant (including flat fee + potential bonus payment)?

USD 2.00 (flat fee) + USD 3.00 (bonus) = USD 5.00 (total costs)

Which experimental software do you plan to use?

Qualtrics.

What is your expected effect size? (Cohen's d for continuous outcome variables and Cohen's h for shares/proportions)'

0.5
